Welcome to the Automated Thematic Analysis Wiki! 🚀

Welcome to the official wiki for the **Automated Thematic Analysis** project (AMOS SS 2026).

This project aims to run qualitative data analysis by automating the extraction and thematic categorization of knowledge from unstructured text, such as interview transcripts. By using Large Language Models (LLMs), our system maps text chunks to a hierarchical thematic tree, building a robust thematic knowledge graph.

★ Key Features

- **Automated Pipeline:** Process source documents and extract structured knowledge.
- **Thematic Knowledge Graph:** Map extracted insights to a hierarchical codebook for deep thematic analysis

- ▼ **theme data type**

- ▼ **theme graph**

and frequency tracking.

- **Advanced AI Integration:** Utilize LangChain to support powerful models (e.g., Qwen, Mixtral, Gemma4) for accurate semantic analysis.
- **Modern Architecture:** Built on top of FastAPI, PostgreSQL (async), and Pydantic, fully containerized with Docker for easy deployment.

Quick Links

These pages will help you get started:

- [Installation & Setup](#): Learn how to quickly spin up the project locally using our bootstrap scripts and Docker.
- [Backend API Reference](#): Explore the core FastAPI application structure, routing, and response formats.
- [System Architecture](#): Dive into the system's core components, including the Ingestion Pipeline and internal data structures (Corpus, Document, Chunk).
- [LLM & Infrastructure](#): Understand our model selection strategies, LangChain integration, and how to run analysis on environments like the FAU GPU Cluster versus the Academic Cloud.

Feel free to navigate through the sidebar to find more detailed documentation on specific components of the platform.
